

American Green Corporation

American Green Corporation's primary business is the surface reclamation of mine lands in Schuylkill County using biosolids as the primary source of nutrients. This is an innovative process using biosolids, flyash and paper waste to produce nutrients and micro-nutrients that are essential to crop growth and suitable vegetative cover.

In 2005, the company had a demonstration project planting Hybrid Poplars on top of 2 by 4 foot trenches filled with biosolids. The trees will reach maturity in eight years.

There are significant environmental benefits from poplar planting. These benefits include revegetation and creation of carbon sink. Carbon sink is plant matter, trees, and grasses that consume carbon monoxide.

American Green provides general lawn service. They also sell Christmas trees both retail and wholesale.
